

## PEPFAR Latest Global Results

2016

Progress to 90/90/90 in Adults (%)

## The epidemic is becoming controlled in several key African countries

### The epidemic is becoming controlled in key African countries

We now have clear evidence from PEPFAR's Population-based HIV Impact Assessments that the epidemic is becoming controlled in older adults and babies in Malawi, Zambia, and Zimbabwe. These countries are approaching the 90/90/90 UNAIDS treatment targets (see page 2 for details).

### 11.5 million men, women, and children on life-saving antiretroviral treatment

PEPFAR is supporting life-saving antiretroviral treatment (ART) for nearly 11.5 million people, exceeding its 2016 target of 11.4 million, and up from the 50,000 individuals who were receiving ART in sub-Saharan Africa prior to when PEPFAR began.

### 11.7 million voluntary medical male circumcisions

PEPFAR supported more than 11.7 million voluntary medical male circumcision procedures in Eastern and Southern Africa to reduce the risk of HIV transmission, exceeding its 2016 target of 11 million.

### Nearly 2 million babies born HIV-free

PEPFAR prevented nearly 2 million babies from being born with HIV, who would have otherwise been infected.

### 1.1 million children on life-saving antiretroviral treatment

PEPFAR is supporting life-saving antiretroviral treatment for nearly 1.1 million children – a 97% increase since 2014.

### 1 million adolescent girls and young women reached through DREAMS

PEPFAR reached more than 1 million adolescent girls and young women with critical comprehensive HIV prevention interventions through the DREAMS Partnership.

### 6.2 million orphans and vulnerable children received care and support

PEPFAR is supporting critical care and support for nearly 6.2 million orphans and vulnerable children to mitigate the physical, emotional, and economic impact of HIV/AIDS on children.

### 220,000 new health care workers trained

PEPFAR supported training (including pre-service training) for nearly 220,000 new health care workers to deliver HIV and other health services.

### 74.3 million people received HIV testing and counseling

PEPFAR supported HIV testing and counseling for more than 74.3 million people, including 11.5 million pregnant women, in FY 2016.

PEPFAR's success is measured in saving lives and changing the course of the pandemic.

By translating groundbreaking research and scientific tools into public health action, and maximizing the impact of every dollar invested, we now have clear evidence that the epidemic is becoming controlled in older adults and babies in several key countries. We have reduced new pediatric infections globally by nearly 70% since 2000, and for the first time show validated declines in adult HIV incidence of (51-76%) across Malawi, Zambia, and Zimbabwe.

These African countries have achieved an average of 65% community viral load suppression among all HIV-infected adults, approaching the 73% target of the 90/90/90 goals. This means they are nearing a point at which HIV transmission would effectively be controlled. However, among adolescents and young people in these same countries, the average community viral load suppression is only 42%. This is particularly concerning as this young population in sub-Saharan Africa is doubling by 2020. We must urgently continue to focus on HIV prevention and treatment for young people, while sustaining gains made in adults and babies.

**Progress to 90/90/90 in adolescents and young adults (15-24 years old) (%)**

These critical surveys are funded by PEPFAR, conducted by the U.S. Centers for Disease Control and Prevention and ICAP at Columbia University, as well as local governmental and non-governmental partners. These surveys along with our program data have allowed PEPFAR to expand results and impact in a budget-neutral environment.

## Results of the PEPFAR Population-based HIV Impact Assessments

Country	HIV Prevalence 15-49	Percent Decline in Prevalence 2003-2015	HIV Incidence 15-49	Percent Decline in Incidence 2003-2015	Overall Community Viral Load Suppression	Community Viral Load Suppression 15 to 24	Community Viral Load Suppression 25 years and older
<b>Zimbabwe</b>
